

# Inspiring Excellence

**Course Title: Programming Language II** 

Course Code: CSE 111 Semester: Summer 2020 Lab 8 Assignment

### <u>Task - 1</u>

Given the following classes, write the code for the **BBAStudent** class so that the following output is printed:

```
class Student:
                                                                           Output
    def __init__(self, name='Just a student', dept=nothing'):
                                                                           Name: default Department: BBA
        self.__name = name
                                                                           Name: Humpty Dumpty Department: BBA
        self.__department = dept
                                                                           Name: Little Bo Peep Department: BBA
    def set department(self, dept):
        self.__department = dept
    def get_name(self):
        return self.__name
    def set_name(self,name):
        self.__name = name
    def __str__(self):
        return 'Name: '+self.__name+' Department: '+self.__department
print(BBA_Student())
print(BBA_Student('Humpty Dumpty'))
print(BBA_Student('Little Bo Peep'))
```

### Task – 2

```
class Vehicle:
                                                          Part 1
                                                          -----
    def __init__(self):
                                                          (0, 0)
        self.x = 0
                                                          (0, 1)
        self.y = 0
                                                          (-1, 1)
    def moveUp(self):
                                                          (-1, 0)
        self.y+=1
                                                          (0, 0)
    def moveDown(self):
                                                          -----
        self.y-=1
                                                          Part 2
    def moveRight(self):
                                                          -----
        self.x+=1
                                                          (0, 0)
    def moveLeft(self):
                                                          (-1, -1)
        self.x-=1
                                                          False
    def __str__(self):
                                                          True
        return '('+str(self.x)+' , '+str(self.y)+')'
                                                          -----
print('Part 1')
print('----')
car = Vehicle()
print(car)
car.moveUp()
print(car)
car.moveLeft()
print(car)
car.moveDown()
print(car)
car.moveRight()
print(car)
print('----')
print('Part 2')
print('----')
car1 = Vehicle2010()
print(car1)
car1.moveLowerLeft()
print(car1)
car2 = Vehicle2010()
car2.moveLeft()
print(car1.equals(car2))
car2.moveDown()
print(car1.equals(car2))
print('----')
```

A vehicle assumes that the whole world is a 2-dimensional graph paper. It maintains its x and y coordinates (both are integers). The vehicle gets manufactured (constructed) at (0, 0) coordinate.

#### Subtasks:

- Design a Vehicle2010 class which inherits movement methods from Vehicle and adds new methods called move UpperRight, UpperLeft, LowerRight, LowerLeft. Each of these diagonal move methods must re-use two inherited and appropriate move methods. Write a user class as well which will show that all of your methods are working.
- 2. Write an "equals" method which tests if significant class properties are the same (in this case x and y).

Note: All moves are 1 step. That means a single call to any move method changes value of either x or y or both by 1.

### Task - 3

Let's Play with Numbers!!!

Write the **ComplexNumber** class so that the following code generates the output below.

```
RealPart: 1.0
class RealNumber:
                                                         ImaginaryPart: 1.0
    def __init__(self, r=0):
        self.__realValue = r
                                                         RealPart: 5.0
                                                         ImaginaryPart: 7.0
    def getRealValue(self):
        return self.__realValue
    def setRealValue(self, r):
        self.__realValue = r
    def ping(self):
        print('I am in RealNumber class')
    def __str__(self):
        return 'RealPart: '+str(self.getRealValue())
cn1 = ComplexNumber()
print(cn1)
print('----')
cn2 = ComplexNumber(5,7)
print(cn2)
print('----')
```

### Task - 4

Write the **CheckingAccount** class so that the following code generates the output below:

```
class Account:
                                                                           Number of Checking
    def __init__(self,balance):
                                                                           Accounts: 0
        self._balance = balance
                                                                           Account Balance: 0.0
                                                                           Account Balance: 100.0
                                                                           Account Balance: 200.0
    def getBalance(self):
        return self._balance
                                                                           Number of Checking
                                                                           Accounts: 3
print('Number of Checking Accounts: '+CheckingAccount.numberOfAccount)
print(CheckingAccount())
print(CheckingAccount(100.00))
print(CheckingAccount(200.00))
print('Number of Checking Accounts: '+CheckingAccount.numberOfAccount)
```

## <u>Task - 5</u>

Given the following classes, write the code for the **Dog** and the **Cat** class so that the following output is printed.

```
class Animal:
                                                  Animal does not make sound
    def __init__(self,sound):
                                                  meow
        self.__sound = sound
                                                  bark
    def makeSound(self):
        return self.__sound
class Printer:
    def printSound(self, a):
        print(a.makeSound())
d1 = Dog('bark')
c1 = Cat('meow')
a1 = Animal('Animal does not make sound')
pr = Printer()
pr.printSound(a1)
pr.printSound(c1)
pr.printSound(d1)
```

### Task - 6

Write the **Mango** and the **Jackfruit** classes so that the following code generates the output below:

```
class Fruit:
                                                        ----Printing Detail-----
    def __init__(self, formalin=False, name=''):
                                                        Do not eat the Mango.
        self.__formalin = formalin
                                                        Mangos are bad for you
        self.name = name
                                                        ----Printing Detail-----
                                                        Eat the Jackfruit.
    def getName(self):
                                                        Jackfruits are good for you
        return self.name
    def hasFormalin(self):
        return self.__formalin
class testFruit:
    def test(self, f):
        print('----Printing Detail----')
        if f.hasFormalin():
            print('Do not eat the ',f.getName(),'.')
            print(f)
        else:
            print('Eat the ',f.getName(),'.')
            print(f)
m = Mango()
j = Jackfruit()
t1 = testFruit()
t1.test(m)
t1.test(j)
```
